Project Executable Files

Date	01 July 2026
Team ID	xxx xxx
Project Name	Rising Water
Maximum Marks	3 Marks

Project Executable Files

This section requires submission of all executable and deployable files for your project. Ensure all files are properly organized, named, and uploaded to the specified submission platform. The evaluator must be able to run or deploy your solution using the provided files and instructions.

Step 1: Submission Checklist

S.No	Item to Submit	Submitted (Yes / No / NA)
1	Complete source code (all files and folders)	Yes
2	README / Setup Guide (instructions to run the project)	Yes
3	requirements.txt / package.json / dependency file	Yes
4	Database schema / seed files (if applicable)	NA
5	Environment configuration file (.env.example or similar)	NA
6	Deployed application URL (if hosted)	Yes
7	APK / Executable binary (if applicable for mobile/desktop apps)	NA
8	Dockerfile / Containerization config (if applicable)	Yes
9	Test files and test results	Yes
10	Demo video or walkthrough (if required)	Yes

Step 2: File / Folder Structure

Provide an overview of your project's file and folder structure below:

```
project-root/
  dataset/  - Flood prediction dataset (rainfall, cloud visibility, seasonal rainfall)
  notebooks/  - Data visualization, preprocessing and model building notebooks
  model/     - floods.save (trained XGBoost model and scaler)
  templates/  - home.html, predict.html, flood_result.html, no_flood_result.html
  static/      - CSS, JS and image assets for the Flask web app
  app.py       - Main Flask application file
  README.md  - Setup and run instructions
  requirements.txt - Python dependencies (NumPy, Pandas, Scikit-learn, Matplotlib, Seaborn, Flask, Joblib/Pickle,
XGBoost)
```

Step 3: Deployment / Access Details

Field	Details
Hosted / Deployed URL	https://smart-bridge-rising-waters.onrender.com
Login Credentials (Demo)	Not applicable – the application does not require login
Platform / Hosting Provider	render
Repository Link	https://github.com/Gayatri344/smart-bridge_Rising-Waters
Demo Video Link	https://drive.google.com/file/d/1pG4X3EnbLGHCGfTuvw1CpYu_kS9g3GzV/view?usp=sharing

Step 4: Run Instructions

Provide clear, step-by-step instructions for the evaluator to run your project locally:

Pre-requisites:
Anaconda Navigator with Python 3.x; Processor: Intel i3 or above; RAM: Minimum 4 GB;
Required libraries: NumPy, Pandas, Scikit-learn, Matplotlib, Seaborn, Flask, Joblib/Pickle, XGBoost

Step 1: Clone or download the project repository
Step 2: Install dependencies: pip install -r requirements.txt
Step 3: Ensure the trained model file (floods.save) is present in the project directory
Step 4: Start the Flask application: python app.py
Step 5: Open a browser and go to: http://127.0.0.1:5000
Step 6: On the Prediction Input page, enter rainfall and weather values to view the flood risk result

Step 5: Known Issues / Limitations

S.No	Known Issue / Limitation	Workaround / Status
1	No known issues identified during testing	N/A
2		
3
