

Customer Journey Map

Date	1 July 2026
Team ID	
Project Name	Rising Waters: A Machine Learning Approach to Flood Prediction
Maximum Marks	2 Marks

Customer Journey Map

Map out the customer's experience stage-by-stage, capturing their actions, touchpoints, thoughts, and feelings, along with process ownership and improvement opportunities at each stage.

Phase of Journey	Stage 1	Stage 2	Stage 3
Actions <i>What does the customer do?</i>	- Hears about the new ML-based flood prediction tool from the disaster management department - Attends a demo/training session on the Flask web application - Explores the home page to understand available features	- Logs into the prediction input page - Enters rainfall, cloud visibility and seasonal rainfall data for a region - Reviews the flood-chance / no-flood-chance result	- Issues evacuation advisories or resource allocation based on results - Shares the prediction with disaster relief coordinators - Monitors the situation as new data comes in
Touchpoint <i>What part of the service do they interact with?</i>	- Internal announcement / email - Flask web app home page - Training or demo session	- Prediction Input Page - Flood Chance / No Flood Chance result page - Underlying XGBoost prediction model	- Alert and communication channels to authorities - Disaster relief coordination meetings - Repeated use of the web app for updated predictions
Customer Thought <i>What is the customer thinking?</i>	"Will this actually be more reliable than our current process?" "How difficult will it be to learn this new tool?" "Can I trust the accuracy of an automated prediction?"	"Is this prediction based on the latest data?" "How confident is the model in this result?" "What if the risk level changes quickly?"	"Did we act early enough to protect the community?" "Should more regions be monitored at the same time?" "How will we validate this decision afterward?"
Customer Feeling <i>What is the customer feeling?</i>	- Curious but a little skeptical - Cautiously optimistic - Slightly overwhelmed by the new technology	- Focused and attentive - Reassured when the result matches expectations - Anxious when a high flood-risk result appears	- Responsible and determined - Relieved when a timely warning helps prevent damage - Motivated to keep improving accuracy

Process Ownership <i>Who is in the lead on this?</i>	Project Team / IT Support (onboarding & training)	Meteorologist / Disaster Management Official (end user)	Disaster Relief Coordinator / Government Authorities
Opportunities <i>How can we improve this stage?</i>	• Provide a simple onboarding guide and short video walkthrough • Offer a sandbox with sample data to build user confidence • Clarify model accuracy figures upfront	• Display a confidence score alongside each prediction • Add historical trend charts for context • Enable quick side-by-side comparison across regions	• Integrate automated alert notifications to relevant teams • Build a feedback loop to log actual outcomes vs. predictions • Expand model validation with post-event data for continuous improvement
