

## Data Flow Diagram

|                      |                                                                |
|----------------------|----------------------------------------------------------------|
| <b>Date</b>          | 1 July 2026                                                    |
| <b>Team ID</b>       |                                                                |
| <b>Project Name</b>  | Rising Waters: A Machine Learning Approach to Flood Prediction |
| <b>Maximum Marks</b> | 2 Marks                                                        |

### Data Flow Diagram

Create a Data Flow Diagram (DFD) to show how data moves through your system - between external entities, processes, and data stores. Use the symbol legend below as a guide.

### DFD Symbol Legend

| Symbol                            | Name            | Description                                                                                                                  |
|-----------------------------------|-----------------|------------------------------------------------------------------------------------------------------------------------------|
| Oval / Rounded shape              | External Entity | A person, organization, or system outside the project that sends or receives data (e.g., Meteorologist, Disaster Authority). |
| Rectangle with numbered header    | Process         | An activity that transforms incoming data into outgoing data (e.g., Preprocess Data, Predict Flood Risk).                    |
| Rectangle (solid fill, no number) | Data Store      | A place where data is held for later use (e.g., Weather Dataset, Trained Model).                                             |
| Labeled arrow                     | Data Flow       | The movement of data between entities, processes, and data stores, labeled with what data is being passed.                   |

### Example

The diagram below shows how data flows through the Rising Waters flood prediction system.
